

FOR IMMEDIATE RELEASE - 26 July 2026

Under the hood of GoMirra: streaming voice, long-term memory, and continuous-thinking AI companions

SYDNEY, Australia - 26 July 2026 - GoMirra (gomirra.com) combines several fast-moving AI capabilities into one consumer product: frontier-model conversation, low-latency expressive text-to-speech, lifelike avatar video, and a persistent memory layer that keeps each relationship continuous across sessions.

Companion voices are generated with modern neural text-to-speech, using voice models created with consent and under licence from recordings by professional adult voice actors. Replies stream in near real time, so a voice conversation flows naturally.

A memory pipeline extracts durable facts, goals, and preferences from conversations, so companions recall what matters without re-asking. While users are away, an optional continuous-thinking mode lets a companion research around the user's goals and email a short note when it finds something worth sharing.

Conversations are tied to the user's account and are never sold; they are processed by the platform's AI providers to run the service and may be reviewed for safety and moderation, as set out in the privacy policy.

About First Kind AI

First Kind AI Inc. operates GoMirra (gomirra.com), an AI companion platform where adults chat by text and voice with personalised AI companions that remember what they share. Every companion is an AI character - not a real person - and the service is strictly for users aged 18 and over. Companion voices are produced with voice models created, with consent and under licence, from recordings by professional adult voice actors.
